Global Monitoring Division

Trace Gas, Ozone and Radiation Standards/Calibrations

2013-2017 Review

Contents:	page
Trace Gas Calibration Standards	2-14
Total Column Ozone (Dobson) Calibrations	15-19
Solar Radiation Calibrations	20-25

Gas Standards and Instrument Calibrations

A. Trace Gas Calibration Standards

High quality, stable trace gas standards are the basis for sustained atmospheric trace gas measurements on century time scales.

The Global Monitoring Division produces and maintains World Meteorological Organization sanctioned trace gas standards for the three most important long-lived greenhouse gases (CO₂, CH₄, N₂O). GMD also maintains in-house calibration scales for over 60 trace gases associated with greenhouse gases and stratospheric ozone recovery.

B. WMO World Primary and Secondary Total Column Ozone Standards

The Global Monitoring Division maintains the WMO Primary and Secondary World Standard Total Column Dobson Spectrophotometers from which the five WMO Regional Standards are calibrated every two years and the ten NOAA Observatory Dobson instruments are calibrated every four years.

C. Solar Radiation Calibration and Standards

The GMD Central Calibration Laboratory maintains systems for performing calibrations of solar UV monitoring instruments. Each year, over 100 instruments are calibrated in the laboratory. Additionally, many instruments are calibrated in the field using the portable field calibrator. The Calibration Laboratory's systems include: Irradiance scale transfer system, UV spectral responsivity measurement system, Angular response measurement system, Absolute spectral irradiance calibration system and the Portable field calibrator system.

A. GMD Trace Gas Calibration Standards

Accurate, reliable calibrations are an essential component of all high quality monitoring programs, and are required for proper interpretation of measurements of atmospheric gases. Long-term drift or bias among different instruments and components must be characterized or minimized. For data from multiple networks to be interpreted together, they must be linked to a common calibration scale. Many global atmospheric measurement communities rely on GMD to provide that linkage.

Most gases measured by GMD are traceable to primary standards developed by GMD. Two methods are used to prepare primary gas standards. Primary standards for CO₂ consist of compressed air in aluminum cylinders for which CO₂ mole fractions have been determined manometrically: that is, the mole fraction of CO₂ is determined by measuring state variables (pressure, temperature, volume) as CO₂ is extracted from air. For other gases (CH₄, CO, N₂O, halocarbons) primary standards are prepared gravimetrically by adding known masses of components together to create a gas mixture of known composition. In both cases, the results are traceable to national standards (mass, temperature, pressure) maintained by NIST.

GMD serves as the WMO/GAW Central Calibration Laboratory for CO₂, CH₄, CO, N₂O, and SF₆. In this capacity GMD maintains world reference calibrations scales and distributes calibrated gas mixtures to participating WMO/GAW laboratories and other cooperating institutions. GMD also provides calibrated gas mixtures of other gases to laboratories in support of cooperative research on climate, ozone, and ocean tracer work. In all, GMD maintains calibration scales for over 60 different compounds.

Even though GMD prepares and maintains primary standards, these are used only to calibrate specific instruments in Boulder. Calibrations are transferred to other instruments within GMD and externally through gas cylinders containing real air, filled at a research site west of Boulder at ~3000m elevation. Gas cylinders are filled with air using techniques developed to ensure the integrity of the mixtures, calibrated in Boulder using dedicated instruments, and distributed world-wide. Over the last 20 years, approximately 3070 and 4300 gas mixtures have been prepared and calibrated for use within GMD and by other laboratories, respectively.

Real Air Standards Prepared and Calibrated Each Year Since 1993

Glass manifold on the CO_2 manometer used for extracting CO_2 from air. The manometer is used to determine the mole fraction of CO_2 on an absolute basis.

Moving gas cylinders into the CO_2 calibration laboratory. Here, CO_2 mole fractions are assigned based on the WMO X2007 scale.

Niwot Ridge, Colorado (~ 3000m a.s.l.), where gas cylinders are filled with clean air.

Collecting a known mass of liquid reagent (gas) in a glass capillary tube that will be later added to a large tank of air to make a calibration standard.

Weighing cylinders on a special balance to determine how much gas was added. These tanks and their contents are weighed to an accuracy of 1 part in a 1,000,0000.

Measuring the concentration of carbon dioxide in cylinders of standard gases.

Institutions the Global Monitoring Division Provided Trace Gas Standards to in the Past 5 Years

Standards are provided on an "at cost" basis.
